

FOR IMMEDIATE RELEASE:

## Delta Systems Inc. Introduces: Digital Slope Display

*This easy-to-read visual display allows the operator to instantly recognize the exact angle of the terrain, ensuring an extra element of safety.*

STREETSBORO, Ohio (October 1, 2012) –Delta Systems Inc. now offers a digital slope display (complementing their slope indicator module) that gives riders an easy visual of the **exact** degree the mower is operating on. The digital readout removes any guesswork from the operator, keeping him or her informed and more safety conscious when mowing on slopes and hillsides. In addition, a light will signal once an operator reaches a 20 degree angle—warning that he or she is operating under more dangerous mowing conditions.

Ventrac is the first mower in the industry to incorporate this feature. Ventrac tractors have a history of providing the “ultimate slope mower” by including features such as a low center of gravity, wide stance with duals, all-wheel drive, and weight transfer to provide a secure mowing experience for operators. This year the company unveiled its new Ventrac 4500 tractor which offers an added element of operator safety—Delta’s slope indicator module with new digital slope display. The digital slope display is ideal for commercial mowing conditions as it accurately reads the terrain the operator is riding on, is completely sealed (IP67 rating), and will not fade or fog in harsh environments.

“ This completes what we are doing for slopes. The display is very visible, accurate, and easy to use. I looked long and hard for other products and no one compares. ”
